Background: Scientists have an increasing responsibility to share research findings and disseminate information on emerging threats. This presentation provides guidance on communicating research findings and mitigation strategies to educate all parties to the function of the system responsible for intervention, and the process by which scientists define and research the problem to meet the public’s need.

Results (Scientific Abstract)/Collaborative Partners (Programmatic Abstract): Based on this this strategic planning process, an Office of Global Initiatives was developed and expanded with a 5-year plan for collaboration in two global regions (http://www.cumc.columbia.edu/nursing/global/index.html).
